

ABSTRACT

A file handling system is provided that typically includes a terminating file transfer server, an agent, and a configuration file. The terminating file transfer server typically receives a file transfer message from an originating file transfer server. The
5 file transfer message can include details about the transfer including a local user and a filename. The agent typically reads the file transfer message, and directs the transfer of a file associated with the filename to a home directory of the local user. The configuration file typically resides in the home directory, and instructs the agent to transfer the file to a remote host. Methods and other systems are also provided.
